The aim of this study was to evaluate outcomes and quality of life (QOL) in patients with sporadic and familial primary hyperparathyroidism (PHPT) treated with total parathyroidectomy (TPE). A prospective study from January 2004 to December 2010 included a total of 239 patients, including 143 with sporadic PHPT (s-PHPT) and 96 with familial PHPT (f-PHPT). Surgical approach was bilateral (n = 39), total (n = 180), and subtotal (n = 20), and procedures were successful in all patients. TPE was curative in 144 patients (60.8%): 52 with s-PHPT and 92 with f-PHPT. Four patients were submitted to total thyroidectomy (1.7%): 1 patient with recurrent s-PHPT with goiter, and 3 patients with f-PHPT with nonsecretor phenotype and mild PHPT. The mean follow-up was 51 months. Normalization of serum calcium was achieved with a single or two doses of calcium. PHPT was present in 45 patients (19.2%) in the s-PHPT group and in 23 patients

Effects of osteoporosis medication on endometrial thickness. Women taking osteoporosis medications (Bisphosphonates) have lower bone density and a higher risk for osteoporosis-related fractures. Our purpose was to evaluate the effect of osteoporosis medications on endometrial thickness. A prospective cohort study was performed. Women treated with osteoporosis medications (Bisphosphonates) for 6 months prior to study enrollment (N=75) were compared with a control group of women not using osteoporosis medications (N=146). Primary end points were the percent change in endometrial thickness on ultrasound at 6-month follow-up. Secondary end points were endometrial thickness at baseline and the percent change in endometrial thickness from baseline to 6-month follow-up in each treatment group. Endometrial thickness at baseline and 6 months was not significantly different in the two groups. In the osteoporosis medication group, endometrial thickness decreased by 20.0% (P=0.0001) and in the control group
