password due to. A Long-Term Comparison of the Hemoglobin Oxygenation Index Between the Pulsed and Continuous Wave Doppler Methods. The Doppler-estimated hemoglobin (Hb) oxygenation index (IO) is an estimate of Hb saturation that is used to monitor regional tissue perfusion in clinical practice. This study compared IO estimates using the pulsed Doppler method with those of the continuous wave (CW) Doppler method in children and adults. Doppler studies were performed in 300 patients who presented to the emergency department (ED) over a 10-month period, where the IO was estimated by both methods. IO was estimated by the CW Doppler method using an algorithmic approach and by the pulsed Doppler method using a formula. An IO of less than 0.3 was considered abnormal. In 100 patients (aged 2-17 years), the IO from the CW Doppler method averaged  $0.22 \pm 0.14$ , and the IO from the pulsed Doppler method averaged  $0.32 \pm 0.12$ . IO assessments in 240 patients (aged 18-93 years) showed an IO of less than 0.3 in 17 patients (7.1%), and the average IO from the CW Doppler method in this population was  $0.28 \pm 0.11$ . In both groups, a strong correlation (Spearman  $r = 0.75$ ,  $P < 0.001$ ) was observed. What is the c6a93da74d
