PLAXIS 2D is a very useful software package. PLAXIS, an advanced finite element package, contains the following functions: deformation analysis, soil-structure interaction analysis, structural analysis, soil kinematics analysis, shape design, boundary analysis, poroelastic analysis, soil consolidation and damage analysis, soil-plant interaction and moisture analysis, groundwater motion and flow, soil-soil interaction, fracture and creep analysis, strength analysis, filter analysis, and structure reinforcement analysis. PLAXIS has been developed by INTERFACES (Interactions of Applied Constitutive Equations), Neirisoft (Borough, Borough, and Barry). The finite element software is a very powerful software package that can be used as a Structural Engineer. It solves the seismic loading problem in short interval time, but solutions are not very desirable for long duration. PLAXIS 2D (PLAXIS v.b 2008) [5] was used to calculate the soil strength and bearing capacity reduction due to the impact of coastal flooding and erosion due to sea-level rise. PLAXIS is an approximate n-dimensional finite element software which draws outstanding and powerful plots, combined with a user-friendly interface, and an intuitive and rich information system, PLAXIS is a complete technical, conceptual, and graphical engineering tool, which allows the user to analyze any problem and is suitable for engineers, scientists, and students to solve a variety of problems.

Plaxis is an advanced, cross-platform finite element software package for studying and analyzing engineering structures from three-dimensional models. A powerful engineering analysis suite, "PLAXIS", is based on the scientific foundations established over decades of research in Engineering Geotechnics. This product is a comprehensive platform, which includes the package for analysis, the ability to simulate life cycles, visualization, postprocessing,

consolidation modeling and many others. 5ec8ef588b
