
Topaz Gigapixel AI 4.1.2

the other thing that's nice about gigapixel is that unlike other software, it doesn't hang your computer. unlike photoshop or lightroom, it doesn't even take up a lot of your computer resources. it doesn't even use your gpu (graphics processing unit). so it doesn't feel like it's eating up your resources. so when you run it, it'll run for hours. you can have it running and just edit a few photos without it freezing up or slowing down the system. this is one of the reasons that we have been able to support gigapixel for so long. we believe that people shouldn't have to have their computers slowed down by software they didn't ask for. gigapixel doesn't do that. it's perfect for people who don't have an extra half hour or hour to edit their images. topaz gigapixel 5.0.1 is significantly faster than its predecessor. it also has added features. we have revamped gigapixel's ui and it now can be used from a lightbox view to a full screen mode. the new interface also allows you to quickly adjust the levels of sharpening and noise reduction. you can also go to the "advanced settings" and fine tune the amount of sharpening and noise reduction by using the sliders. overall it's a solid upgrade. some of you may have gotten the message that topaz is shutting down. sorry, we are not. the company is fine. we are just changing the model that we offer for the next iteration of our products. we believe in offering a range of products and options for different types of photographers and different types of projects. some of the features and options that we offered in our previous programs might not be appropriate for some. and some of our previous products are not yet supported by adobe. we hope you will understand and continue to support us.

Topaz Gigapixel AI 4.1.2

as i mentioned in the preamble, photoshop was much faster than gigapixel. it took about 15 minutes for the image to enlarge from 240 to 480 pixels in photoshop. acorn was about 3 minutes faster than photoshop. topaz gigapixel was again much slower than photoshop. finally, i tried to give the image a bit of a makeover using the topaz sharpen ai. it has a really simple interface

with one button. once you select the area of the image you wish to sharpen, and you then select the sharpening type, for example, the amount of sharpening. i found that the automatic selection of the sharpening was fairly accurate. so, there you have it. this is the end of my first review of topaz

labs apps. i have to admit that i am a bit disappointed with the results. hopefully, they will sort this out in the next release. in the meantime, if you are planning to purchase topaz labs apps, i would suggest that you get the trial version first. i

had the exact same experience with the latest version of topaz gigapixel as i did with the previous version. i had to use some of the previous settings to get the result i wanted but even then the image ended up pixellated, colour-distorted, and to a lesser extent, over-sharpened.

after processing, i couldnt see any difference between the two, which is what i expected. the gigapixel ai process isnt going to make a bad image look good but its not going to make a good image look any better either. if you want to try topaz, download the free trial and give it a whirl.

it's a very useful tool for those who do a lot of image manipulation for clients. but be aware that you're going to have to spend a lot of time tweaking the settings and making sure it doesn't

make any bad artifacts for your finished product. if you're not happy with the results, then you have the option of buying it afterwards and trying the settings that worked best for you. 5ec8ef588b
